

### **What is MapKeyboard?**

MapKeyboard is a free program to remap your keyboard. Using MapKeyboard, you can alter any key on your keyboard to function as a different one or altogether disable it as well. This is an essential tool for laptop users and other people with keyboards whose keys differ from the standard 101 keyboard layout. The changes made are universal across all applications & games and best of all, MapKeyboard does not even need to be actively loaded in memory.

### **Program usage guide & Other information**

MapKeyboard does not need any installation. Just unzip all the files in the zip file into any folder of your choice and run MapKeyboard.exe. Note: MapKeyboard needs Microsoft .Net Framework 3.0

After launching the program, click any key on the window (with your mouse) and then set it another key by selecting an item from the list box at the bottom-left of the window. Repeat the same for as many keys as you need. If you need to disable the key, select "Disabled" from the list box. Note that keys which are mapped are shown in a green highlight. To remove a key remap, just select its original item in the listbox and the highlight should disappear.

After you are done with remapping the keys, click "Save layout" button on the bottom-right of the window to save your keyboard mapping. If you want to remove the whole keyboard mapping i.e. set the default layout, click "Reset Keyboard Layout"

That's it, just logout and log back into your windows user account to apply your mappings. Note that MapKeyboard does not need to be running for the changes to remain in effect. You only need to run it when you want to change the keys again on your keyboard or reset them.
